Semester: VIII, CSE Department

ABSTRACT

We are developing a Legal Document Analysis System for the Company. ClauseGuard AI is used to efficiently analyze legal documents and assist users in understanding complex contracts. The main aim of ClauseGuard AI is to provide a well-structured analysis of legal documents and also maintain a clear summary of important clauses and risk factors.

The system can process uploaded documents and provide intelligent insights to the users. ClauseGuard AI consists of an informative part, containing the clause title, descriptive information, risk level, category, and stage of analysis. A separate block consists of details such as document upload time, analysis time, and completion status.

A next area contains information regarding the document analysis process. Each document has assigned components such as extracted text, analyzed clauses, and identified risks. The system also provides a chat-based interface where users can interact with the document and get answers based on its content.

ClauseGuard AI consists of a complete analysis history of the document which is available directly in the main window – together with the information of what was analyzed, how it was processed, and when the analysis was performed within the system.
